#Name : Algam Sai Krishna #Roll no: 21X05A6703 #Branch : Data Science #College: Narsimha Reddy Engineering College

#Project Title Analysis of Prediction of "small_customers.csv"of American mall markets called as phonic small.To find out how many customers are visited to aparticular shop.On basis of this prediction of annual income Versus Spending scores.

#Disclaimers In this particular dataset we assume annual income as centroid and spending score frome the range 1-100 called as datanodes of cluster.

#Problem Statement The American finance market as per the GDP of 2011"phonix_trillums"mall as in first range out 5.The owner of the mall wants to be exact which particular shop or products search in different types of clusters in entire mall.

As a data science Engineer predict the futuristic financial for the upcoming gdp rate based on No.of Cluster.The client wants atleast 5 top clusters(shop).

#Conclusion According to the model basics prediction using machine learning algorithm KMeans clustering we found that cluster 1 is in red colour is highest cluster which attach more than 50 data nodes

#refernce The model building algorithm develop for all kinds of clusteration values.The yellow spots represents centroids which is max to max only 3.

[13]:
```
#import the numpy, matlot, pandas libery's
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
```

[23]:
```
#Read the dataset take variable name called "dataset" only.
dataset=pd.read_csv("Mall_Customers.csv")

# without printing this data add in separet variable as input variable Caqpital␣
 ↪X only. loc index by select the all row ,
#and give the required colum index like[3,4].for this particular dataset.
X=dataset.iloc[:,[3,4]].values
```

[27]:
```
## <THE ELBOW METHOD>
#from sklearn used "sklearn.cluster" attribute and import KMeans
#Take a distance from from centroid to cluster point with WrapsColumnExpression.
```

```python
# Assume you have 10 cluster and iterate the for up to range 10 with iterater␣
↪kmeans++.
# Fit the model if value comes too samlla in range.
#For clustering in wcss ,inertia is adding / appending is required.(kmeans.
↪inertia_)#defalut usecase.
#Plot the poarticular graph along with the wcss and your range which you taken␣
↪as input variable.
#Add title "The Elbow Method".
#Lable x variable as "No of Customers".
#Lable y variable as "WCSS".
#Plot the graph using plt.show().
from sklearn.cluster import KMeans
wcss=[]
for i in range(1,11):
  kmeans=KMeans(n_clusters=i,init="k-means++",random_state=42)
  kmeans.fit(X)
  wcss.append(kmeans.inertia_)
plt.plot(range(1,11),wcss)
plt.title("The Elbow Method")
plt.xlabel("No of Cluster")
plt.ylabel("wcss")
plt.show()
```
